

## General Description

The16C53BT is an 8 bit RISC high performance microcontroller. It is equipped with 1Kx14bits OTP(One Time Programmable) ROM, 32 Bytes RAM, Timer/Counter, Interrupt, LVR(Low Voltage Reset) and I/O ports in a single chip.

## 1. Feature

- ROM size: 1K x 14 bits
- RAM: 32 x 8 bits
- STACK: 2 Levels
- One instruction is built by 4 system clock.
- Reset mode:
  - Power-On reset
  - Low voltage reset
  - RESETB/PB3 (if set as reset pin) input a negative pulse.
  - Watchdog timer count overflow reset
- 5 oscillation mode can be selected
  - External RC, LS (Low Speed) Crystal, NS (Normal Speed) Crystal and HS (High Speed) Crystal
  - Internal 4MHz RC oscillator
- Timer/counter: 1 sets.
  - TMR0: 8 bit count down timer/counter
- Watchdog Timer: On chip WDT is based on an internal RC oscillator (for WDT used only). Have 8 period can be selected. User can extend the WDT overflow period by using prescaler.
- Interrupt events:
  - TM0 Internal timer/event counter interrupt
  - External INT pin
- I/O port: 12 pins
  - PA0~3: 4 normal I/O pins
  - PB0~7: 8 pull high I/O pins with pin wake up function
- Wake-up mode: Port B (PB0~7) pin change wakeup
- Different Package Type:  
SG16C53BT: 14 pin SOP

---

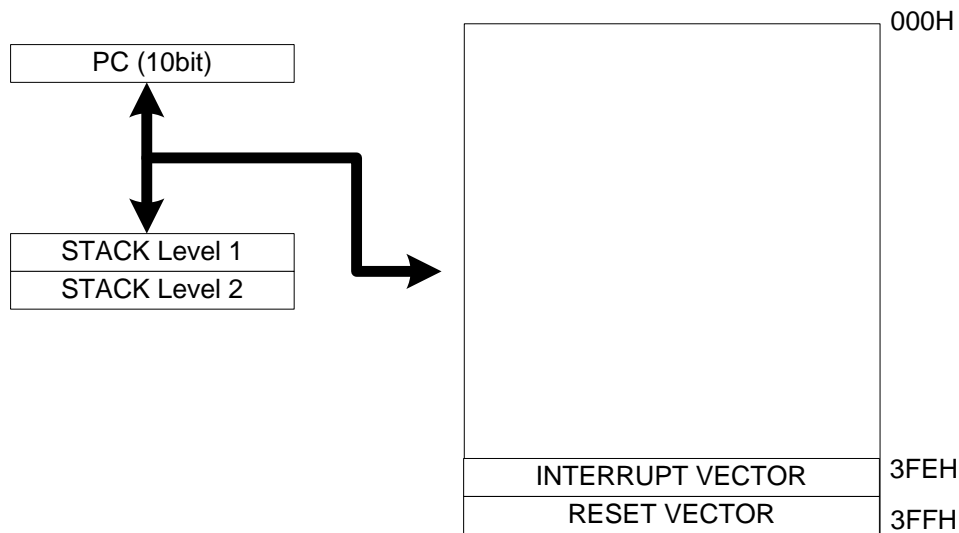

# 1. Memory Map

The SG16C53 have two kinds of memory which are ROM (program memory) and RAM (data memory). The ROM is used to store the program, table and interrupt vectors. It is continuous 1024x14bits and don't need to switch bank. The RAM is 48(16+32)x8bits that include special function register and general-purpose RAM.

## 5.1 Program Memory (ROM)

Instruction and table are stored at this area. There is only one interrupt vector existed which means all the interrupt occurred would jump to the same vector. Programmer should use interrupt flag to judge what kind of interrupt is occurred. The program counter (PC) is 10 bit which can directly address all the 1024x16bits location. Look-up table can be put at anywhere of ROM.

The RESET vector is located at 3FFH and Interrupt vector is at 3FEH. The map is as below:

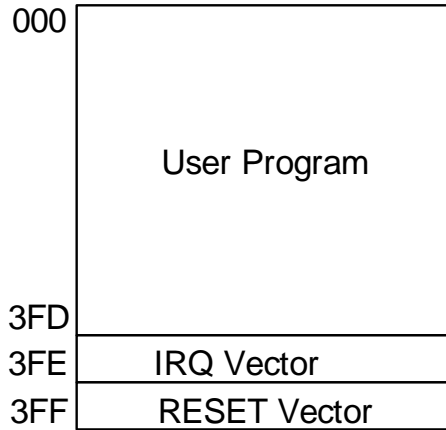

<Note> LCALL and LGOTO allow directly operate 1K word addressing

## 5.2 Data Memory (RAM)

The total RAM volumes are 48x8bits which includes two kinds of register group. One is 32x8bits general purpose RAM, the other is special purpose register that are 16x8bits. Every byte of special purpose register stored control's data or operation's data.

The data memory map is as below:

<Note> LCALL and LGOTO allow directly operate 1K word addressing

#### 4.2.1 Special Purpose Register

Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
CONFIG	ADJ0	RESETE	LV	WDTE	CPT	INRC	FOSC1	FOSC0
	Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
	--	--	ADJ6	ADJ5	ADJ4	ADJ3	ADJ2	ADJ1

<Note> CONFIG is a 16 bit special register

Name	Addr	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
SELECT		TMR0_EN	AUTO	SUR0	EDGE0	PSA	PS2	PS1	PS0

<Note> “—“ : mean no use.

#### 4.2.2 Configure Register

Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
CONFIG	ADJ0	RESETE	LV	WDTE	CPT	INRC	FOSC1	FOSC0
	Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
	--	--	ADJ6	ADJ5	ADJ4	ADJ3	ADJ2	ADJ1

- Bit13~7 (ADJ6~0): Used to calibrated internal RC oscillator.
- Bit6 (RESETE): RESETB pin define  
0: RESETB is normal input pin  
1: RESETB is system reset pin
- Bit5 (LV): Set reset voltage level of Low Voltage Reset (LVR)  
0: Low Voltage Reset ON  
1: Low Voltage Reset OFF
- Bit4 (WDTE): Watchdog timer enable/disable  
0: WDT disable  
1: WDT enable
- Bit3 (CPT): ROM Code Protection bit  
0: ON  
1: OFF
- Bit2~0 (INRC, FOSC1~0): OSC type and system clock select

Bit2	Bit1	Bit0	OSC Type	Resonance Frequency
INRC	FOSC1	FOSC0		
0	0	0	LS (low speed)	System clock=32~200KHz
0	0	1	NS (Normal speed)	System clock=200K~10MHz
0	1	0	HS (high speed)	System clock=10~20MHz
0	1	1	External RC	System clock=32K ~ 10MHz
1	0	0	Reserved	Reserved
1	0	1	Reserved	Reserved
1	1	0	Reserved	Reserved
1	1	1	Internal RC	System clock=4MHz

### 4.2.3 SELECT Register

Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
SELECT	TMR0_EN	AUTO	SUR0	EDGE0	PSA	PS2	PS1	PS0

Select register is used to control WDT and TMR0. There is no specific data memory, it can only be set by SELECT instruction. It is a write-only register. The content of accumulator will be sent to SELECT register by executing the SELECT instruction. If SELECT register has never been set by program, its default value is 40H. The below table will explain each bit of select register.

Bit	Symbol	Description				
		PS2	PS1	PS0	TMR0 rate	WDT rate
2~0	PS2~PS0	0	0	0	1:2	1:1
		0	0	1	1:4	1:2
		0	1	0	1:8	1:4
		0	1	1	1:16	1:8
		1	0	0	1:32	1:16
		1	0	1	1:64	1:32
		1	1	0	1:128	1:64
		1	1	1	1:256	1:128
3	PSA	PSA: Prescaler assignment bit 1: Prescaler assigned to WDT 0: Prescaler assigned to TMR0				
4	EDGE0	EDGE0: TMR0 source signal edge control bit 1: increment when H L transition on external clock 0: increment when L H transition on external clock				
5	SUR0	SUR0: TMR0 clock source bit 1: External clock input 0: (Internal clock) / 4				
6	AUTO	AUTO : Auto pre-load TMR0 data 1: enable 0: disable				
7	TMR0_EN	TMR0_EN: TMR0 enable/disable 0: disable 1: enable				

## 6. Function Deceptions

This device provide many functions that are I/O ports, Timer, WDT, Interrupt, Table location, Reset, Program Counter and STATUS register. We would like to describe in detail.

### 6.1 I/O Port

There are 2 I/O ports (A & B) to input or output data, each port has different function. The port A are general purpose I/O port with pull down resistor. The port B have multiple functions which can be used as general purpose I/O port with pull up resistor and pin wake up function. And some of them have another function by option.

#### 6.1.1 Port A

##### A. PA(\$05H):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PA		--	--	--	PA3	PA2	PA1	PA0

- Bit3~0 (IOA3~0): Data of I/O ports A

##### B. PA\_PDM(\$0BH):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PA_PDM	--	--	--	--	DA3	DA2	DA1	DA0

- Bit3~0 (DA3~0): Pull down resistor enables/disable  
 0: Pull down resistor disable.  
 1: Pull down resistor enable.

#### 6.1.2 Port B

##### A. PB(\$06H):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PB	PB7	PB6	PB5	PB4	PB3	PB2	PB1	PB0

- Bit7~0 (PB7~0): Data of I/O Ports B

##### B. PB\_PUP(\$0CH):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PB_PUP	UB7	UB6	UB5	UB4	--	UB2	UB1	UB0

- Bit7~0 (UB7~0): Pull up resistor enable/disable.  
 0: Pull up resistor disable.  
 1: Pull up resistor enable.

<Note> 1. PB3 is shared with RESETB and only can be used as input port. If used as PB3 then there is no pull up resistor. If used as RESETB, then there is pull up resistor.

2. UB4 and UB5 is used in RC oscillation mode only. If user use Crystal mode, then these two bits are useless and can not be set to pull up. Otherwise, it will cause malfunction.

### C. PB\_PDM(\$0DH):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PB_PDM	RTCCE	INTE	--	--	--	DB2	DB1	DB0

- Bit7: This bit has two functions, one is to select PB2/RTCC function, another is to enable TMR0 external clock source.  
0: PB2 pin is PB2  
1: PB2 pin is RTCC input and TMR0 external clock source from RTCC is enable

<Note> The method to count RTCC input are:

1. Use SELECT instruction to set SUR0 to 1.
2. Set RTCCE bit to 1 to set PB2 pin as RTCC and enable the RTCC clock in.

- Bit6: Select PB0/INT function  
0: PB0 pin is PB0  
1: PB0 pin is INT
- Bit2~0 (PB2~0): Pull down resistor enable/disable  
0: Pull down resistor disable  
1: Pull down resistor enable

### D. PB\_POD(\$0EH):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PB_POD	OB7	OB6	OB5	OB4	--	OB2	OB1	OB0

- Bit7~0 (OD7~0): Open drain enable/disable  
0: Open drain disable  
1: Open drain enable

<Note> PA\_PDM(\$0B), PB\_PUP(\$0C), PB\_PDM(\$0D), PB\_POD(\$0E) are write only register which can only use below instructions to write data :

```
MOVLA  REG_Value
MOVAM  PB_PDM
```

### E. WAKEUP(\$0FH):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WAKEUP	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0

- Bit7~0 (EN7~0): Port B wakeup enable/disable  
0: Port B wakeup disable  
1: Port B wakeup enable

## 6.2 Timer/Counter(TMR0)

The SG16C53 provide one countdown timers/counters and 1 watchdog timer. Clock source of counters can be system clock or external clock by setting each timer control register. The detailed registers setting and block diagram are as below.

### A.TMR0(\$01H):

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TMR0	D7	D6	D5	D4	D3	D2	D1	D0

- Bit7~0 (TMR0): Timer0(TMR0) Data

<Note> The timer is down counter timer. When it down counts to 00 that will occur underflow and TM0F will be set to "1". At this moment, the zero flag will not be affected. So, please read TM0F to judge whether it underflow or not.

## 6.3 Indirect Addressing

Register IAR(\$00) and BSR(\$04) will be used to address indirectly. BSR (Bank Select Register) allows 5-bit wide operand to directly access the whole data (00~3F) memory. The method is as below map:

Direct Addressing Mode

(BSR) (opcode)

Data Memory

Indirect Addressing Mode

(BSR)

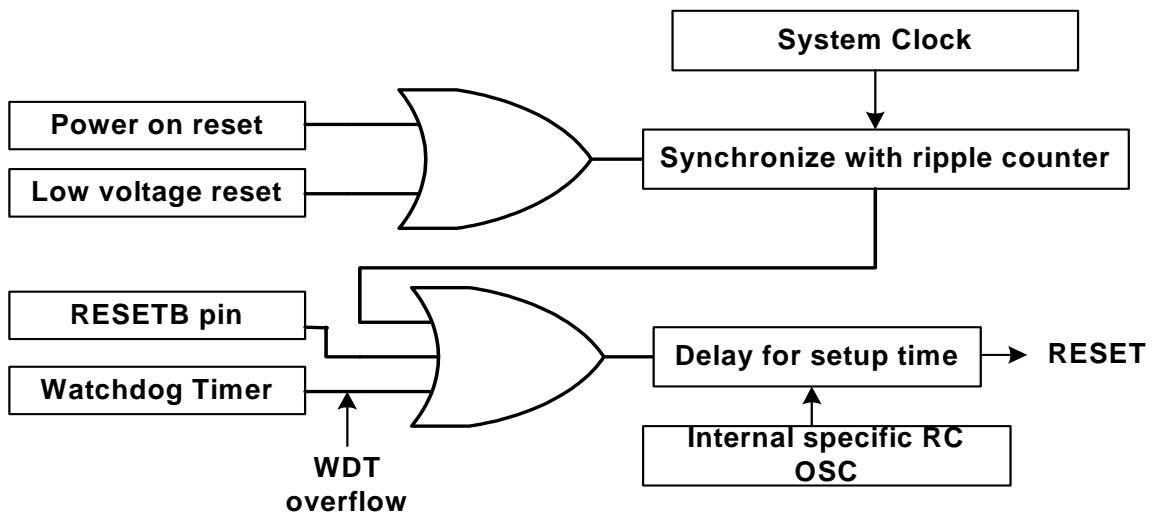

## 6.4 WDT (Watchdog Timer)

WDT is a timer to prevent software from malfunction or jumping to an unknown location with unpredictable result. The source clock of WDT is an independent internal RC oscillator. This timer would be affected by temperature, voltage and different production lot. The minimum time is around 20ms. Programmer can use SELECT instruction to set prescaler and get the different duration.

## 6.5 Reset

There are 4 events will cause reset which is listed as below. The power-down event will cause SG16C53 reset. This condition is used to protect chip in deficient power environment. The last two cases are called warm reset. Different reset events will affect registers and RAM. The  $\overline{TO}$  and  $\overline{PD}$  bits can be used to determine the type of reset.

- (1) Power-on reset.
- (2) Low voltage reset (LVR).
- (3) RESETB pin reset (input a negative pulse).
- (4) WDT timer overflow reset.

System Reset Block

<Note>: the watchdog setup time is approximately 20ms that will has some tolerance due to power voltage, process and temperature variations.

Address	Name	Cold Reset	Warm Reset
N/A	Accumulator	xxxx xxxx	pppp pppp
N/A	IODIR	PB	1111 1111
		PA	1111
N/A	SELECT	0100 0000	0100 0000
00h	IAR	---- ----	---- ----
01h	TMR0	xxxx xxxx	pppp pppp
02h	PCL	11 1111 1111	11 1111 1111
03h	STATUS	0001 1xxx	#00# #ppp
04h	BSR	1xxx xxxx	1ppp pppp
09h	IRQM	0000 0000	0000 0000
0Ah	IRQF	0000 0000	0000 0000

0Bh	PA_PDM	xxxx 0000	xxxx 0000
0Ch	PB_PUP	0000 x000	0000 x000
0Dh	PB_PDM	00xx x000	00xx x000
0Eh	PB_POD	0000 x000	0000 x000
0Fh	WAKEUP	0000 x000	0000 x000
20h~3Fh	General Purpose RAM	xxxx xxxx	pppp pppp

<Note> x: unknown; p: keep as previous data ; #: value depends on condition  
 -:unimplemented and read as"0".

### 6.5.1 Reset condition of STATUS register

Condition	Status Register	
	$\overline{TO}$	$\overline{PD}$
1.Power-on reset	1	1
2.RESETB reset during normal operation <sup>&lt;Note 3&gt;</sup>	U	U
3.RESETB reset during sleep <sup>&lt;Note 3&gt;</sup>	1	0
4.WDT reset during sleep	0	0
5.WDT reset during normal operation	0	1
6.Wake up by pin changed	1	0

<Note> 1. If execute CLRWDT then the content of item 4,5 would not be as the above.

2. U: Unchanged

3. The data of  $\overline{TO}$  and  $\overline{PD}$  is as the table only when reset and PSA bit (SELECT register) was set to "1". If PSA doesn't set to "1", the data after reset is not as table.

### 6.6 Interrupt

The SG16C53 provides 2 interrupts which are TMR0 and external INT. IRQM and IRQF registers are used to control or declare request state of all interrupts. IRQM is used to enable/disable interrupt and IRQF is used to indicate which interrupt is occurred. If the specific IRQM doesn't enable then the hardware interrupt would not occurred. But the IRQF will response the status no matter how IRQM enable or not. For example, user enable TMR0 to start counting. If IRQM bit 0 is enabled, the hardware interrupt would generate when timer overflow and IRQF bit 1 will be set. At the same time, program will jump to interrupt vector. User should clear IRQF in interrupt service routine, otherwise the interrupt would not work properly. Another condition is if IRQM bit 0 is disabled, the interrupt would not generate when timer overflow, but IRQF bit 1 still will be set. Program would not jump to interrupt vector.

### A. IRQM (\$09H)

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IRQM	INTM	--	--	--	--	--	PB0M	TM0M

- Bit7 (INTM): Global enable bit.
  - 0: Disable. All interrupts are mask.
  - 1: Enable. All interrupt are unmask

When interrupt is serving, the INTM will reset to “0” to prevent the other interrupt happen. After served, the IRETI instruction will set INTM as ‘1’.
- Bit1 (PB0M): external INT pin interrupt enable/disable
  - 0: Disable Interrupt
  - 1: Enable Interrupt
- Bit0 (TM0M): TMR0 interrupt enable/disable
  - 0: Disable Interrupt
  - 1: Enable Interrupt

### B. IRQF (\$0AH)

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IRQF	--	--	--	--	--	--	PB0F	TM0F

- Bit1 (PB0F): external INT pin interrupt flag
  - 0: Interrupt signal occurred
  - 1: Interrupt signal doesn't occurred
- Bit0 (TM0F): TMR0 interrupt flag
  - 0: Timer overflow occurred
  - 1: Timer overflow doesn't occurred

## 6.7 STATUS Register

The STATUS register is an 8-bit register that contains the zero flag (Z), carry flag (C), Nibble carry flag (DC), power down flag ( $\overline{PD}$ ), and watchdog timer overflow flag ( $\overline{TO}$ ). It records the status information.

### A. STATUS(\$03H)

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STATUS	--	--	--	$\overline{TO}$	$\overline{PD}$	Z	DC	C

- Bit4 ( $\overline{TO}$ ): Timer overflow flag bit
- Bit3 ( $\overline{PD}$ ): Power down flag bit

$\overline{TO}$	$\overline{PD}$	Description
0	0	WDT timer overflow from sleep mode
0	1	WDT timer overflow from normal mode
1	0	Input a 'low' at RESETB from sleep mode
1	1	Power on reset
Unchanged	Unchanged	Input a "low" at RESETB from normal mode

- Bit2 (Z): zero flag bit
  - 0: the result of a logic operation is not zero
  - 1: the result of a logic operation is zero
- Bit1 (DC): Nibble Carry and Nibble *Borrow* flag bit
  - ADD instruction:
    - 0: no carry
    - 1: a carry from the low nibble bits of the result occurred
  - SUB instruction
    - 0: a borrow from the low nibble bits of the result occurred
    - 1: no borrow
- Bit0 (C): Carry and *Borrow* flag bit
  - ADD instruction:
    - 0: no carry
    - 1: a carry occurred from the MSB
  - SUB instruction
    - 0: a borrow occurred from the MSB
    - 1: no borrow

## 6.8 Wake up function

The chip provide pin signal toggle wake up function. It will return from sleep mode when signal toggle in input port. In order to safely wake up from sleep mode, we suggest to read the input pin to store data before entering sleep mode. The sample program is as below:

```

MOVLA    FFh
IODIR    PORTB    ;// set bit0~7 of port B as input. Only input pin can be wake up
.....
MOVVM    PORTB,a ;//Store the data of input pin before sleep
SLEEP                                ;// if doesn't perform the read instruction, then can not enter
                                           ;// SLEEP mode
NOP                                          ;//Add NOP instruction to delay a while when chi

```

## 7. Instruction

<Note> Instruction cycle is system clock/4

Mnemonic Operands	Instruction Code (Advance)	Cycles	Status Affected	OP-code
ADD M, m	(M)+(acc) (M)	1	C, DC, Z	01 0101 1MMM MMMM

XOR M, m	(M) xor (acc) (M)	1	Z	01 1011 1MMM MMMM
XOR M, a	(M) xor (acc) (acc)	1	Z	01 1011 0MMM MMMM
XORLA I	Literal xor (acc) (acc)	1	Z	11 1000 iiiiiiii

<Note> After SLEEP instruction, please add a NOP instruction to perform transient.

## 7. Electrical Characteristics

### 7.1 Absolute Maximum Ratings

Supply Voltage .... V<sub>SS</sub>-0.3V to V<sub>SS</sub>+5.5V      Storage Temperature ..... -50      to 125  
Input Voltage ..... V<sub>SS</sub>-0.3V to V<sub>DD</sub>+0.3V      Operating Temperature .... 0      to 70

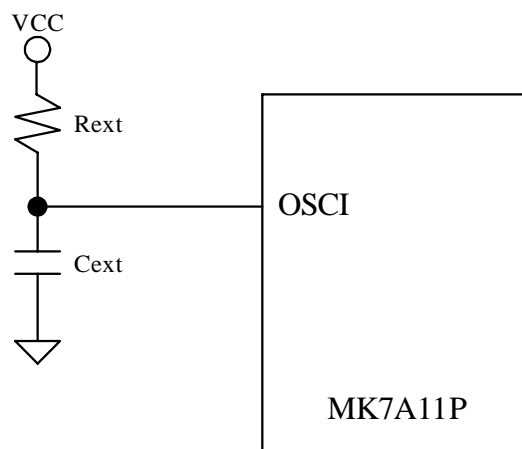

## 7.2 DC Characteristics

Symbol	Parameter	Test Conditions		Min.	Typ.	Max.	Unit
		VDD	Conditions				
VDD	Operating Voltage	---		2.2		5.5	V
V <sub>IH</sub>	Input High Voltage	5V	I/O Port	2		V <sub>dd</sub>	V
V <sub>IL</sub>	Input Low Voltage	5V	I/O Port			0.8	V
I <sub>DD1</sub>	Standby Current	5V	WDT disable			1	μA
			WDT enable			9	
		3V	WDT disable			1	
			WDT enable			2	
I <sub>IL</sub>	Input Leakage Current	5V	V <sub>in</sub> =VDD, VSS			1	μA
I <sub>OH</sub>	I/O Port Driving Current	5.5V	V <sub>oh</sub> =5V			9.9	mA
			V <sub>oh</sub> =4.5V			17.6	
			V <sub>oh</sub> =4V			24.8	
I <sub>OL</sub>	I/O Port Sink Current	5.5V	V <sub>ol</sub> =0.5V			24.5	mA
			V <sub>ol</sub> =0.75V			35.3	
			V <sub>ol</sub> =1V			43.8	

### 7.3 AC Characteristics

Symbol	Parameter	Test Conditions		Min	Typ	Max	Unit
		Conditions	VDD				
f <sub>sys1</sub>	System Clock	LP Crystal mode	5V	32		200	Khz
			3V	32		200	
f <sub>sys2</sub>	System Clock	NT Crystal mode	5V	0.2		10	Mhz
			3V	0.2		10	
f <sub>sys3</sub>	System Clock	HS Crystal mode	5V	10		20	Mhz
			3V	10		20	
f <sub>sys4</sub>	System Clock	RC mode	5V		4MHZ	4.5	Mhz
			3V		4MHZ	4.5	
T <sub>wdt</sub>	Watchdog Timer		5V		20		mS
			3V				
T <sub>rht</sub>	Reset Hold Time		5V		20		mS
			3V				

### 7.4 EXT\_RC Oscillator Frequencies

The typical external RC oscillation frequency is as below table

When  $C_{ext} = 0.01\mu f$  (103)

Rext	5V	3V
300K	500 KHZ	470 KHZ
120K	1.1 MHZ	1.1 MHZ
65K	2.1 MHZ	2 MHZ
32K	4.3 MHZ	4.1 MHZ
17K	8.3 MHZ	8 MHZ
14K	10.3 MHZ	10 MHZ

## 8. Package Dimension

(a) 14 Pin DIP

SYMBOLS	DIMENSIONS IN MILLIMETERS			DIMENSIONS IN INCHES
